

Now i am making a propoasl to solve the model training problem for AMD. Nvidia which is an AMD compititos has developed an huge AI ecosystem we are concentraing on physical AI. Wrt to robotics and physical AI. Nvidia has a huge collection of AI models(<https://catalog.ngc.nvidia.com/?topTech=model>); which means diue to the ecosystem advantage from many years companies accross the world has developed infra around the model and pipelines and over time these pipelines have become appkications, now when you go and pitch AMD hW which is 50% lowe capex and 30%lower operational costs baseson certain cirteria the application development company will not be willing to swuthc because there is a large infra build aroud that and shifting it will cost a lot of engeering cyccles which is also a capex for the applicaiton developwmnt robotic company, this coswt will the more in caae small and midsize company and this feature reflects in sales.

Problem: AMD: Amd as an org has manu bussiness units and each bussiness unit operates based on its funds which reflect the closer the engineering
